Acces PDF Meiosis Lab Analysis And Conclusions

Meiosis results in the formation of gametes. in plants, fungi, and animals. These cells have half the chromosome number of the parent cell ($1n$). Mitosis, cell division, is best observed in cells that are growing at a rapid pace, such as in the whitefish blastula. or onion root cell tips.

The process called meiosis makes gametes, sperm and eggs, and spores in plants. Gamete or spore cells have half the chromosomes that the parent cell has.

Sex cells replicate in a total of ten stages as opposed to mitosis in five stages. The stages of Meiosis are:

prophase I, metaphase I, anaphase I, telophase I, cytokinesis, prophase II, metaphase II, anaphase II, telophase II, and ends when the gamete is produced.

This process continues until the cell stops replicating.

Conclusion - The Cell Cycle
The purpose of our lab today was to examine the stages of Mitosis.

The cell goes through many phases in the cell cycle. The stages are

Interphase and M phase. Interphase is

made up of Gap 1

Phase (G1), Synthesis

(S), and the Gap 2

Phase (G2). We will be

focusing on the M

phase in today's blog.

The M phase consists

Meiosis includes two rounds of divisions (Meiosis I and Meiosis II), unlike mitosis in which the nucleus divides only once. The parent cell in meiosis produces four haploid (n) daughter cells, each with one half of the chromosomes of the parent cell.
