Combinatorics is the study of discrete structures in general, and enumeration on discrete structures in particular. For example, the number of three-cycles in a given graph is a combinatoric problem, as is the derivation of a non-recursive formula for the Fibonacci numbers, and so too methods of solving the Rubiks cube. Different kinds of counting problems can be approached by a variety of ...

Olympiad Combinatorics 2 Incidence Matrices Let A_1, A_2, \dots, A_n be subsets of $S \subset \{d, \omega, \dots, m\}$. A convenient way to express this information is by drawing an $n \times m$ matrix, with the n rows representing A_1, A_2, \dots, A_n and the m columns representing the elements of S . Entry $a_{ij} = 1$ if and only if element j belongs to A_i . Otherwise ...

Olympiad Combinatorics 6 the starting player remains an open problem. In addition, the game of tic-tac-toe in higher dimensions (such as on 3-D cubes or in general, n -dimensional hyperspaces) has strong connections to a branch of extremal combinatorics known as Ramsey theory. Olympiad Combinatorics 4 other words, select a_1, a_2, \dots, a_k such that $a_1 + a_2 + \dots + a_k \leq$ but $a_1 + a_2 + \dots + a_k + a_{k+1} >$ Now we cannot select any more from the top row as we would then violate the problem's condition so in the remaining columns choose elements from the bottom row. We just need to prove that the sum of the ...
