Using a fuel pump with two plungers. Altering the fuel cam or cam follower position. By using specially designed fuel pumps such as sulzer fuel pumps. VIT is employed to advance fuel injection timing so that maximum combustion pressure or Pmax is reached at about 85% load. This gives a more efficient engine by lowering the fuel consumption. See the diagram below. The figure above shows variation of Pmax for a fuel pump with VIT (shown in red line) and without VIT (shown in dotted red line).

Sulzer RTA72U Marine Diesel Engine The diesel engine is a type of internal combustion engine which ignites the fuel by injecting it into hot, high-pressure air in a combustion chamber. In common with all internal combustion engines the diesel engine operates with a fixed sequence of events, which may be achieved either in four strokes or two, a stroke being the travel of the piston between its extreme points.

This article covers the History of Sulzer diesel engines from 1898 to 1997. Sulzer Brothers foundry was established in Winterthur, Switzerland, in 1834 by Johann Jakob Sulzer-Neuffert and his two sons, Johann Jakob and Salomon. Products included cast iron, firefighting pumps and textile machinery. Co-operation with Rudolf Diesel led to the construction of the first Sulzer diesel engine in 1898.

Well-proven fuel pumps It employs high-efficiency fuel pumps based on the well-proven design of injection pumps used in Sulzer medium-speed engines. They run on multi-lobe cams to deliver adequate quantities of fuel to the common rail at the usual high pressure ready for injection. The common rail is, in effect, a manifold running the length of the
